                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by introducing the DNA into the plant, and a transgenic plant into which a neoxanthin cleavage enzyme is introduced. The inprovement of stress tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid land can be improved by growing transformant weed for several years and then removing the weed by specifically lowering stress tolerance in the weed by inducing an inducible promoter. The present sequence is Arabidopsis thaliana neoxanthin cleavage enzyme, AtNCED3 protein. The AtNCED3 cDNA is obtained from an Arabidopsis plant-derived cDNA library using a cDNA of the CPRD65 (CowPea Responsive to Dehydration) gene isolated from cowpea plant as a probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to neoxanthin cleavage enzymes and their corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key role in endogenous abscisic acid (ABA) biosynthesis under drought stress. Neoxanthin cleavage enzyme is used for improving stress tolerance in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence

                                                                                                                                                                                                                                                                                                                                   corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key role in endogenous abscisic acid (ABA) biosynthesis under drought stress. Neoxanthin cleavage enzyme is used for improving stress tolerance in a plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by introducing the DNA into the plant, and a transgenic plant into which a neoxanthin cleavage enzyme is introduced. The improvement of stress tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid then removing the weed by specifically lowering stress tolerance in the weed by inducing an inducible promoter. The present sequence is Lycopersicon esculentum neoxanthin cleavage enzyme, LeNCED1 protein related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A DNA encoding

                                                                                                                                                                                                                                                                                                                                     (PION-)
This invention relates to defence-related signalling genes isolated from the sunflower (Helianthus annums). The genes encode a neoxanthin cleavage enzyme (NCE), an amino acid permease (AAP) and a glutamic acid rich protein (GRP). The signalling gene is useful for increasing the

The gene is useful for regulating gene expression in a plant, in response to a stimulus such as infection with a pathogen, damage from a pathogen, hydrogen peroxide, jasmonic acid, methyl jasmonate, salicylic acid, oxalic acid or expression of a gene encoding oxalic acid oxidase. The genes are also useful for stem-preferred regulation of gene expression in a plant. The genes are useful in agriculture, particularly in the present series are acid (ABA) metabolism and for modifying amino acid transport and content in plants. The present sequence represents a neoxanthin cleavage enzyme-like protein from Lycopersicon esculentum used in the

Neoxanthin Cleavage enzyme plays a key role in endogenous abscisic acid (ABA) biosynthesis under drought stress. Neoxanthin cleavage enzyme is used for improving stress tolerance in a plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by introducing the DNA into the plant, and a transgenic plant into which a neoxanthin cleavage enzyme is introduced. The improvement of stress tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid then removing the weed by growing transformant weed for several years and then removing the weed by specifically lowering stress tolerance in the weed by inducing an inducible promoter. The present sequence is vigna unguiculata neoxanthin cleavage enzyme, CPRD65 (Cowbea Responsive to Dehydration) protein. CPRD65 gene is isolated from cowpea plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A DNA encoding a protein wit

role in endogenous abscisic acid (ABA) biosynthesis under drought stress. Neoxanthin cleavage enzyme is used for improving stress tolerance in a plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by introducing the DNA into the plant, and a transcariation also relates to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   neoxanthin cleavage enzyme is introduced. The improvement of stress tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid land can be improved by growing transformant weed for several years and then removing the weed by specifically lowering stress tolerance in the weed by inducing an inducible promoter. The present sequence is arabidopsis thaliana neoxanthin cleavage enzyme, AtNCED1 protein. The AtNCED1 cDNA is obtained from an Arabidopsis plant-derived cDNA library using a cDNA of the CPRD65 (CowPea Responsive to Dehydration) gene isolated from cowpea plant as a probe.

Neoxanthin cleavage enzyme plays a key role in endogenous abscisic acid (ABA) biosynthesis under drought stress. Neoxanthin cleavage enzyme is used for improving stress tolerance in a plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by introducing the DNA into the plant, and a transgenic plant into which a neoxanthin cleavage enzyme is introduced. The improvement of stress tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid and can be improved by growing transformant weed for several years and then removing the weed by specifically lowering stress tolerance in the weed by inducing an inducible promoter. The present sequence is Zea mays neoxanthin cleavage enzyme, VP14 protein related to the invention.

                                                                                                     This invention relates to defence-related signalling genes isolated from the sunflower (Helianthus annuus). The genes encode a neoxanthin cleavage enzyme (NCE), an amino acid permease (AAP) and a glutamic acid rich protein (GRP). The signalling gene is useful for increasing the resistance of a plant to a pathogen such as fungus, virus, bacterium, nematode or insect (e.g. European corn borer), preferably incorporating a construct containing the gene into the genome of the plant. The gene is useful for regulating gene expression in a plant, in response to a stimulus such as infection with a pathogen, damage from a pathogen, hydrogen peroxide, jasmonic acid, methyl jasmonate, salicylic acid or expression of a gene encoding oxalic acid oxidase. The genes are also useful for stem-preferred regulation of gene expression in the plant. The genes are useful in agriculture, particularly in the
a plant. The genes are userul in agriculture, purchased and in the conditying abscisic acid (ABA) metabolism and for modifying amino acid transport content in plants. The present sequence represents a neoxanthin cleavenzyme-like protein from Zea mays used in the characterisation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated defence-related signalling gene isolated from sunflower encoding neoxanthin cleavage enzyme, amino acid permease or glutamic acid-rich protein useful for increasing resistance of plant to a

The invention relates to neoxanthin cleavage enzymes and their CC corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key CC role in endogenous abscisic acid (ABA) biosynthesis under drought stress. CC Neoxanthin cleavage enzyme is used for improving stress tolerance in a cC plant when expressed in a plant cell. The invention also relates to comethods for increasing or decreasing stress tolerance in a plant by cintroducing the DNA into the plant, and a transgenic plant into which a cleavage enzyme is introduced. The improvement of stress cc tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme serial for producing transgenic plants. An arid cc cleavage enzyme genes are useful for producing transgenic plants. An arid claavage enzyme genes are useful for producing transgenic plants. An arid cc claavage enzyme genes are useful for producing stress tolerance in the cc weed by inducing an inducible promoter. The present sequence is cc Arabidopsis thaliana neoxanthin cleavage enzyme, AtNCED5 protein.

CC The AtNCED5 cDNA is obtained from an Arabidopsis plant-derived cDNA cc library using a cDNA of the CPRD65 (CowPea Responsive to Dehydration) cc gene isolated from cowpea plant as a probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Matcn

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to neoxanthin cleavage enzymes and their corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key crole in endogenous abscisic acid (ABA) biosynthesis under drought stress. Neoxanthin cleavage enzyme is used for improving stress tolerance in a plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by commethods for increasing or decreasing stress tolerance in a plant by the DNA into the plant, and a transgenic plant into which a neoxanthin cleavage enzyme is introduced. The improvement of stress tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid cleavage enzyme genes are useful for producing transgenic plants. An arid cleavage enzyme genes are useful for producing transgenic plants. An arid cleavage enzyme the weed by growing transformant weed for several years and then removing the weed by specifically lowering stress tolerance in the weed by inducing an inducible promoter. The present sequence is arabidopsis thaliana neoxanthin cleavage enzyme, AtNCED2 protein.

The AtNCED2 cDNA is obtained from an Arabidopsis plant-derived cDNA library using a cDNA of the CRRD65 (CowPea Responsive to Dehydration) cleaves is solated from cowpea plant as a probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

This invention relates to defence-related signalling genes isolated from Ct the sunflower (Helianthus annuus). The genes encode a neoxanthin cleavage CC enzyme (NCE), an amino acid permeases (AAP) and a glutamic acid rich CC protein (GRP). The signalling gene is useful for increasing the CC resistance of a plant to a pathogen such as fungus, virus, bacterium, CC nematode or insect (e.g. European corn borer), preferably incorporating a construct containing the gene into the genome of the plant. The gene is CC useful for regulating gene expression in a plant, in response to a stimulus such as infection with a pathogen, damage from a pathogen, CC hydrogen peroxide, jasmonic acid, methyl jasmonate, salicylic acid, coxalic acid or expression of a gene encoding oxalic acid oxidase. The genes are also useful for stem-preferred regulation of gene expression in a plant. The genes are useful in agriculture, particularly in the Dreeding of crop plants with improved agronomic traits, for modifying abscisic acid (ABA) metabolism and for modifying amino acid transport and content in plants. The present sequence represents a neoxanthin cleavage content is plants. The present sequence represents a neoxanthin cleavage

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to neoxanthin cleavage enzymes and their corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key role in endogenous abscisic acid (ABA) biosynthesis under drought stress. Neoxanthin cleavage enzyme is used for improving stress tolerance in a plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by introducing the DNA into the plant, and a transgenic plant into which a neoxanthin cleavage enzyme is introduced. The improvement of stress tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme growing transformant weed for several years and then removing the weed by specifically lowering stress tolerance in the weed by inducing an inducible promoter. The present sequence is a ransparathin cleavage enzyme is theliana neoxanthin plants enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Arabidopsis thailana neoxanthin cleavage enzyme, AtNCED4 protein. The AtNCED4 cDNA is obtained from an Arabidopsis plant-derived cDNA library using a cDNA of the CPRD65 (CowPea Responsive to Dehydration) gene isolated from cowpea plant as a probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
